

One Fixture. Two color temperatures.  
*And everything in between!*

Color temperatures can have a huge impact on spaces are perceived and can be a critical element in design spaces. **Emotion** technology makes using different fixtures for various color temperatures a thing of the past. **Emotion** offers the flexibility of two color temperatures (3000K and 6000K) in one fixture and since they are equipped with the same plug-in system, they can be used with all standard drivers.

You can completely customize your lighting using optional accessories which allow for an array of color temperatures ranging anywhere between 3000K and 6000K based on your environment or needs.

**Emotion** has the most advanced solutions for switching and component control. Additional options are available by using the **Emotion** driver, such as:

- Inline Touch Switch with full temperature control (3000K-6000K) and incremental dimming
- Remote Control/Receiver with up to 4-channels of switching control
- Bluetooth connectivity
